GEOSPARQL 3D WHITE PAPER

TECHNICAL PAPER

CANDIDATE SWG DRAFT

Version: 1.0
Submission Date: 2029-03-30
Approval Date: 2029-03-30
Publication Date: 2029-03-30
Editor: Editor One, Editor Two

8 INTRODUCTION

8 INTRODUCTION

GeoSPARQL is an open standard that enables storage and exchange of spatial data on the Web, based on the Resource Description Framework (RDF). Although not specifically bound, the current version of GeoSPARQL (1.1) is mainly geared towards spatial objects having zero to two dimensions. In other words, things that can be displayed on a flat surface. However, for three-dimentional spatial objects both supply and demand are increasing.

A future version of GeoSPARQL is expected to have extended capabilities supporting three-dimensional space. Not only would that make GeoSPARQL more useful for 3D geospatial data, it would also help in industries and knowledge domains that are not mainly focused on geospatial data, like Building Information Modelling (BIM) and Computer Graphics (CG). This paper describes which extensions to GeoSPARQL for 3D are most desirable, and how they could be achieved.

The paper consists of three main parts. The first explains the need for additional 3D capabilities in GeoSPARQL. It lists expected benefits, and describes how users and implementers of GeoSPARQL can reap them. The second part describes current capabilities of GeoSPARQL. In its current state, GeoSPARQL does allow modelling three-dimensional objects, but with relevant limitations. The last section describes requirements for extended 3D capabilities in GeoSPARQL. The latter is based on a market consultation, which resulted in a collection of use cases for additional 3D capabilities. By analysing those use cases, as well as current developments within and outside the OGC, insight in the most needed extensions to GeoSPARQL can be obtained. Requirements are then weighed against feasibility; some extensions are easier to achieve than others.

This paper should be interesting for the following audiences:

- Current and prospective users of GeoSPARQL;
- Current and prospective implementers of GeoSPARQL;
- Members of related OGC working groups.

9

BENEFICIARIES AND BENEFITS

9 BENEFICIARIES AND BENEFITS

This section describes the beneficiaries and benefits of representing data, including geospatial data, using semantic and graph technologies. Furthermore, a collection of use cases demonstrate how semantic and graph technologies are used together with spatial data to tackle real world problems.

9.1. Beneficiaries

9.1.1. Beneficiary 1: Someone who benefits

9.2. Benefits

The benefits of semantic and graph technologies are outlined below.

9.2.1. Benefit B1: My benefit

10

CURRENT CAPABILITIES

10 CURRENT CAPABILITIES

10.1. GeoSPARQL

GeoSPARQL is the most common geospatial extension of SPARQL. It was accepted as an OGC standard in 2012 and revised as GeoSPARQL 1.1 in 2024.

According to the standard document, “The OGC GeoSPARQL standard supports representing and querying geospatial data on the Semantic Web. GeoSPARQL defines a vocabulary for representing geospatial data in RDF, and it defines an extension to the SPARQL query language for processing geospatial data”.

10.1.1. Requirements addressed

GeoSPARQL addresses the following requirements with regards to 3D.

10.1.2. Adoption of GeoSPARQL 1.1

11

REQUIREMENTS FOR GEOSPARQL 3D

11 REQUIREMENTS FOR GEOSPARQL 3D

This section provides an overview of feedback received on the current version of the GeoSPARQL standard (version 1.1) regarding 3D usage. This feedback helps to identify some of the barriers to use, and to outline requirements that have not been addressed that may encourage greater uptake.

11.1. Proposed extensions for GeoSPARQL 3D

11.1.1. Extension 1:
